SAFE SOAK

Safe Soak is a loose cellulose granules which has been sieved, sized, coloured and chemically treated to make it fire retardant. It has been independently tested at Fire Research centre and complies with BS 476 Class 1 part 7. It is packed in a 30 Litre bag which weighs on average 6-7 kgs and has the absorbency power equivalent to 3 bags of clay.

Safe Soak works in a completely different way to clay granules in that it works by capillary action, were the spilt liquid is absorbed into the fibre structure. It starts to work immediately on contact with a liquid. Clay granules absorb, this means liquid sticks (coats) to the granules by surface tension.

Safe Soak can be incinerated so avoiding expensive and ever increasing land fill taxes. Like all loose absorbents, it will take on the properties of the liquid it's absorbing, so must be disposed of in the correct manner complying to current Legislation.

SAFE SOAK SUMMARY

- Cost effective: 3x's more absorbent than Clay Granules
- Highly absorbent, capillary action
- Absorbs immediately on application thus preventing spreading
- User friendly (light weight bag)
- Does not stick to floor
- Can be incinerated (7% Ash)
- Dust free
- Manufactured from sustainable source
- Re-cycled materials (including pacaging)

Delivered direct from our supplier at full or half pallet loads in 3 working days (UK mainland ONLY).
